

# Lab 9 - Data Transformation

*Johnathan Hsu*

*November 3rd, 2017*

1. In addition to simply naming variable names in select you can also use : to select a range of variables and - to exclude some variables, similar to indexing a `data.frame` with square brackets. You can use both variable's names as well as integer indexes.
  - a. Use `select()` to print out a `tbl` that contains only the first 3 columns of your dataset, called by name.
  - b. Print out a `tbl` with the last 3 columns of your dataset, called by name.
  - c. Find the most concise way to select the first 3 columns and the last 3 columns by name.

```
# setting directory

## 8         1        41         5
## 9         3        46         6
## 10        4        42         5
## # ... with 42,426 more rows
```

```
efficient_df <- data_95_96 %>%
  select(MONRACE, YEAR, MONSEX, EDUCATN, XCRHISSR, DISTRICT, MONCIRC)
```

2. dplyr comes with a set of helper functions that can help you select groups of variables inside a `select()` call:

- `starts_with("X")`: every name that starts with “X”,
- `ends_with("X")`: every name that ends with “X”,
- `contains("X")`: every name that contains “X”,
- `matches("X")`: every name that matches “X”, where “X” can be a regular expression,
- `num_range("x", 1:5)`: the variables named x01, x02, x03, x04 and x05,
- `one_of(x)`: every name that appears in x, which should be a character vector.

Pay attention here: When you refer to columns directly inside `select()`, you don’t use quotes. If you use the helper functions, you do use quotes.

- Use `select()` and a helper function to print out a `tbl` that selects only variables that contain a specific character string.
- Use `select()` and a helper function to print out a `tbl` that selects only variables that start with a certain letter or string of letters.

```
select(test, contains("STAT"))
```

```
##      STATMIN STATMAX
## 1         120     540
## 2          0     252

## [ reached getOption("max.print") -- omitted 9103 rows ]

```

4. Are there any mutations you wish to carry out on your data (i.e. new variables you wish to create based upon the values of already existing variables)? If so, describe what they are and what you will name them.

Yes - I want to find the guideline range by subtracting the statutory minimum from the maximum, I'll name it GUIDERANGE.

5. You can use mutate() to add multiple variables at once. To create more than one variable, place a

comma between each variable that you define inside `mutate()`.

- a. Carry out any and all of the mutations you wish to perform on your dataset and print the results to the console.

```
test <- mutate(test, GUIDERANGE = STATMAX - STATMIN)
```

```
## Warning: package 'bindrcpp' was built under R version 3.3.2
```

6. R comes with a set of logical operators that you can use inside `filter()`:

- `x < y`, TRUE if `x` is less than `y`
- `x <= y`, TRUE if `x` is less than or equal to `y`
- `x == y`, TRUE if `x` equals `y`
- `x != y`, TRUE if `x` does not equal `y`
- `x >= y`, TRUE if `x` is greater than or equal to `y`
- `x > y`, TRUE if `x` is greater than `y`
- `x %in% c(a, b, c)`, TRUE if `x` is in the vector `c(a, b, c)`

- a. What are some potential subsets of your data that seem interesting and worth investigation to you? I need to filter out the prison times that are just time sentences (excluding death penalty, and LWOP).
- b. Use at least two of the logical operators presented above to print these subsets of your data.

```
filter(test, MONSEX == "Male")
```
